# Name of the experiment 

Student Name<br>date of the experiment

#### Abstract

In this experiment we studied something very important and measured the value of another thing. The velocity we determine is $V=45 \pm 3 \mathrm{~km} . \mathrm{s}^{-1}$, this is not in agreement with values measured by Author [2010]. This might be due to some problems in our experiments, we could improve this by doing something.

## 1 Introduction

Galaxies are very interesting. Measuring their properties is very important. We even have an equation (see equation 1)

$$
\begin{equation*}
V=\frac{8 \pi a^{-5}}{3 \lambda} \tag{1}
\end{equation*}
$$

where a is the distance to the Sun, $\lambda$ is something else.... Don't forget to explain what each variable means the first time that you introduce it.

This is also where you explain the aims of the experiment.

## 2 Method

Describe what you did (not the names of files and directories of course, but all the important steps that bring you to the results). Why did you do this? did you have to make some choices along the way - explain them. Did it not work well the first time, and you had to improve something? write about it

Include diagrams/photos of the experimental setup (see Figure 1), or screenshots highlighting important steps of the process.

## 3 Results and Analysis

In this section you will need to show your results. Use tables and figures (long tables can be put in an Appendix). Table 1 is an example.

Here explain how you determine uncertainties for different measured values.
If in the process of data analysis you found any noticeable systematic error(s), you have to explain them in this section of the report.

Figure 1: Every figure MUST have a caption.

Table 1: Every table needs a caption.

| distance $(\mathrm{m})$ | $\mathrm{V}\left(\mathrm{km} \mathrm{s}^{-} 1\right)$ |
| :---: | :---: |
| 0.0044151 | 0.0030871 |
| 0.0021633 | 0.0021343 |
| 0.0003600 | 0.0018642 |
| 0.0023831 | 0.0013287 |

## 4 Discussion and Conclusion

Here you briefly summarize your findings. Do your results match published values? If not, what could the source(s) of errors? How could the experiment be improved?
